Ensayo del tema:

“medical instrument”

Medical instruments are a set of devices, machines and tools necessary to carry out a specific intervention. They are designed to provide healthcare personnel with assistance in performing a basic maneuver and are made of high-quality materials such as stainless steel or even titani.

Depending on its use, we can classify it as: disposable, emergency, maternity, monitoring.

Next I leave a small list of essential material in hospitals:

- ECG machine: this equipment records the electrical activity of the heart
  
- Stress systems: used in Cardiology, help determine the body's response and test it beyond the normal level.
- Surgical lights: they are designed to facilitate illumination during surgeries
  
- Diagnostic ultrasound: This system offers a method of examining the body and does not resort to radiation.
  
- Sterilizers - kills all types of microbes, including viruses, fungi, bacteria, spores, and more.
  
- Defibrillators: used to treat fatal conditions such as cardiac arrhythmias and tachycardia.
