PHARMACIST

The well-being of a person is very important and when it comes to a patient it is necessary to take into account each of their needs. For which, when it comes to acquiring a prescribed medication, a pharmacist must be consulted, who is responsible for ensuring, through the application and knowledge and functions related to patient care, that the use of medications is safe and appropriate, and who needs specialized education or structured training. It also requires that the collection and interpretation of data is judicious, that there is motivation by the patient and that there are interprofessional interactions, Arbezù M. (Apr. 2000).

Thus, what the pharmacist does is investigate the effects of pharmaceutical products, in addition to being in charge of verifying that the effects of new or modified medications, since these can be altered and produce harmful side effects for the health of the patient. On the other hand, their functions are that they work together with researchers or doctors to discover, develop, refine and evaluate new pharmaceutical products and improve existing ones. In addition to examining specimens and samples, they use computers, high-tech measurement systems, and other specialized equipment, conduct and publish research papers that help complement the work they do in the specific area of their research.

However, as all work has its degree of complexity, it is not easy to achieve the desired results from the team that works in the pharmacy office. You can hire qualified individuals, adapt them to our way of working and develop your skills without all this guaranteeing success for the satisfactory performance of your tasks, and even less of your commitment to the pharmacy office.

The person's performance is related to the ability to do their job and the predisposition to do it. Therefore, while selection and training are oriented towards the individual's ability or aptitude to carry out his work, we frequently forget the disposition or attitude that one has to carry it out.

It is worth mentioning that the difficulty that the pharmacist meets is complicated but there is also the nice part where he has to interact with the people or patients who need to be provided with the medicines requested in his prescription, but also the coexistence with the Co-workers result in a better performance in efficiency or effectiveness regarding the work that the pharmacist performs day by day.

All of the above allows for a more general overview of the pharmacist's work, as well as the difficulties or facilities that he has in carrying out his work, as well as the fact that part

of everything he does pleases him more when he thinks about the patient, his health and its circumstances, and let's not waste the human, technical and professional resources that any member of the healthcare chain can contribute, in this case the pharmacist is part of that healthcare chain.
