Supernote

Student Name: Cynthia Cristell Ugalde Oporto

Name of the theme: I´m Sick

Partial: 2nd

Matter name: English

Professor's name: José Jesús Hernández

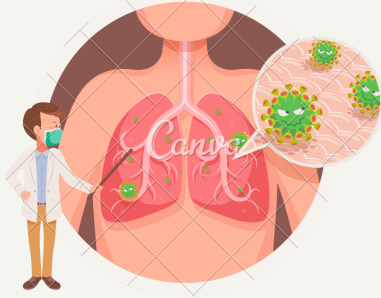

Bachelor's name: Nursing

Four -month: 3rd

PNEUMONÍA

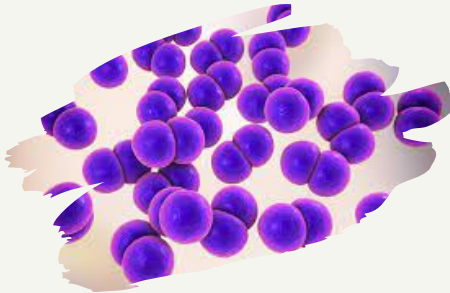

Definition

Pneumonia is an infection that affects one or both lungs. It causes the air sacs, or alveoli, in the lungs to fill with fluid or pus. There are bacteria, viruses or fungi that can cause pneumonia

Pathogen

La neumonía más común es la producida por una bacteria llamada neumococo (*Streptococcus Pneumoniae*).

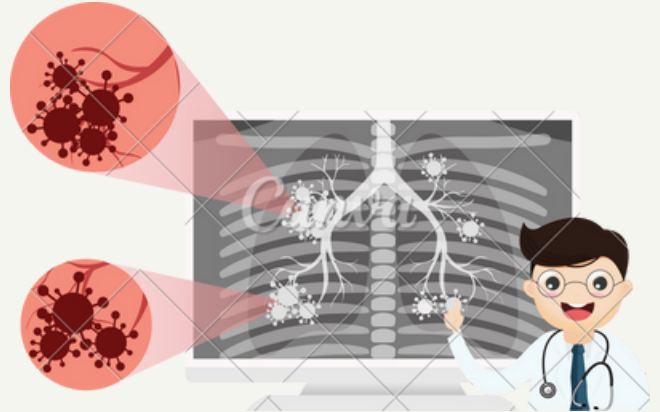

Symptoms

- Chest pain when breathing or coughing
- Disorientation or changes in mental perception (in adults 65 years and older)
- Cough that can produce phlegm
- Fatigue
- Fever, sweating, and chills with shaking
- Lower than normal body temperature
- Nausea, vomiting or diarrhea
- Difficulty breathing

Diagnostic

- A chest X-ray is often used to diagnose pneumonia.
- Blood tests, such as a complete blood count (CBC), are used to find out if the immune system is fighting an infection.

Treatment

- If the treatment is orally: moxifloxacin or levofloxacin or amoxicillin clavulanate plus a macrolide.
- If the treatment is intravenous, the treatment would be: 3rd generation cephalosporin or amoxicillin clavulanate, associated with a macrolide or levofloxacin in monotherapy.
