IMPORTANCE OF VETERINARY

To begin with, what is Veterinary Medicine? Veterinary medicine is a branch of medicine that is responsible for the care, treatment and control specifically of animals, it is responsible for providing security to the population to bring control over highly contagious diseases to humans, the main objective of this essay is to know the history of veterinary medicine, as well as the processes it has gone through to reach what it is today, it is also necessary to know the functions and importance of veterinary medicine in our society and the impact it causes in this same, it will analyze the contributions with which it has contributed in the modern world.

The origin of veterinary medicine dates back to the year 2000 BC.c, there is a record that approximately began to be practiced in Babylon and Egypt, as far as it is known the Greeks were the first to practice it since they had special doctors to treat horses, which for the first time were called "horse doctors" then as we can see this was one of the first approaches that humans had with medicine and animals, because humans depended on animals and the products that can be obtained from them, As we know in today's world veterinary medicine is extremely important because thanks to this many researches have been made that have not only contributed to veterinary medicine, but also to human medicine, as a result of these researches have emerged vaccines and treatments for various diseases and pathologies, as well as research on zoonotic diseases. Veterinary medicine has also developed technological advances that have later been used in human medicine, such as organ transplants, which were mainly done and experimented in animals and then carried out in humans The health of animals is also of great importance for us humans as we are highly related to them by food, because the health of humans needs a correct nutrition therefore it is necessary to obtain animal products of good quality for consumption, this is where the veterinary plays a big role, because this is of great help for food security and the proper development of animals used for human consumption, An example is the cow, so that it can be consumed needs to carry a

series of responsible care that veterinarians are in charge of doing to ensure the health of these animals, because these are in our diet should be healthy to avoid diseases in consumers, with this we see that veterinarians play a great role in preventing humans from contracting diseases from animals. Veterinarians also perform functions such as public health, in addition to protecting ecosystems and the environment, with this we see that veterinary medicine is a multidisciplinary subject that encompasses many functions in one, In the field of public health and as I mentioned before, veterinarians also deal with other functions such as ensuring the safety of the population in the face of the threat of new diseases that can affect people, such as rabies and avian flu, veterinarians are responsible for monitoring any problems that are potentially dangerous to the population in relation to animals, veterinarians are also linked to biomedical research, since this is the area that specializes and is responsible for the search for cures for new diseases in animals and after the process of experimentation veterinarians are responsible for monitoring compliance with the rules stipulated to carry out these experiments. Medication is also of great importance in veterinary medicine, as it helps to treat diseases, reduce and alleviate the pain that these animals may suffer, these drugs also help us in the production of new medicines, also help us in the production of animal products so that they are safe and of good quality for the consumption of medicines.

After this analysis we can conclude that veterinary medicine is multidisciplinary and has a great importance in society. However, it is not only responsible for the care of animals as it is believed, but also for a wide range of aspects with great importance, such as research and prevention of diseases, not only in animals but also pathologies that could affect humans, as we learned veterinary medicine continues to advance along with technology and advances in society to improve day by day.
