TRABAJO

Ensayo “Historia de la Veterinaria”

DOCENTE

Ing. Eduardo E. Arreola Jiménez

CURSO

“1º. B”

Fecha de entrega

Miércoles, 20 de septiembre del 2023

"VETERINARY HISTORY"

As a starting point we will talk about the history of the veterinarian indicating the first veterinarians, dates and place of beginning to medicine, veterinary, we will know about medications, food, how important the animal is for humanity, among other things with the objective of publicize the public what is necessary for food, care, management, reproduction and finally production in animals.

Veterinary Medicine Medical Specialty related to the prevention, control, diagnosis and treatment of diseases that affect the health of animals and the prevention of animal diseases to people. People who serve as doctors have existed since the early and veterinary times the practice was already established as a specialty already in 2000 "c. In Babylon and Egypt. The ancient Greeks had a class of doctors who were called "doctoral horses. Today veterinarians serve worldwide in private clinical practice and. Corporate, academic, programs, private industry, government service, public health and military services. Veterinary medicine has made many important contributions to animal and human health. Including are dramatic reductions in animal sources of human exposure to tuberculosis and brucellosis. The vaccine developed for the control of the Marek disease in chickens was the first cancer vaccine. The first phase or basic science consists in the study of classroom and laboratory work in preclinical sciences, including the fields of anatomy, physiology, pathology, pharmacology, toxicology, nutrition, microbiology and health public The second phase focuses on clinical sciences and includes the study of the classroom of infectious and non -infectious diseases, diagnostic and clinical pathology, obstetrics, radiology, anesthesiology, surgery and practice management and practical clinical experience in the veterinary teaching hospital of veterinary education in University. The clinical experience provides students with the opportunity to treat sick animals, perform surgery and communicate with animals. Animals are responsible for producing some important foods. These foods make our balance complete diet and help us to live a healthy life. We still depend on the animal for resources such as eggs, milk, meat, etc., therefore, the health of animals is indirectly related to human health. Due to the consumption of food produced from these animals, it can affect our health. Most of the human population in India is in cattle raising. They depend on their cattle to win their daily bread. Taking into account the importance of animal health, the Veterinary Medicine Company in India formulates these medications that can treat the health condition of animals. People who run farms have to provide their animals with all essential nutrition, animal protein and others items. Ensures their good health and maintains the production of goods of these animals. The scope of veterinary medicine today

are the only policy of educated doctors to protect the health of animals and people. They work hard to address the health and well-being needs of each animal species.

To conclude I feel that veterinary medicine not only influences animals, but also helps in human beings, because thanks to animals we have the animal product, which is egg, milk, came, etc. So it is very necessary that animals are healthy and strong for human survival.
