# "Nursing and its relationship with other sciences"

## Anatomy

The specific skills acquired with the development of anatomy are essential and facilitate the understanding and development of a large part of the subjects of the degree, providing the student with essential instruments on the knowledge of the different structures and components.

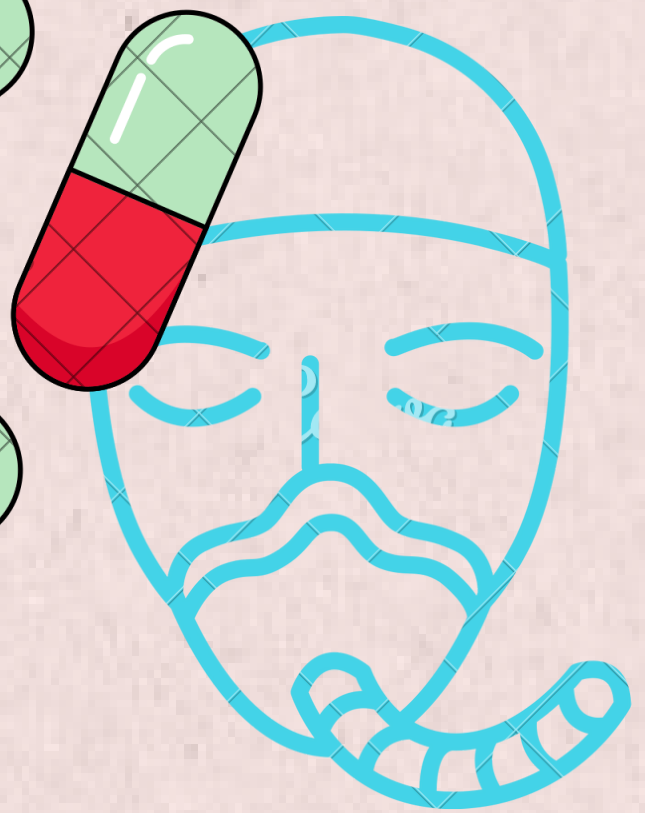

## Physiology

In the area of health science, knowledge of the normal functioning of the human body is of utmost importance, which allows professions to have a better development of attitudes in their work environment, which is why it is important to strengthen the bases of knowledge, starting from the micro to the macro.

## Anesthesiology

The main objectives of the nurse's role in general anesthesia are to provide optimal surgical conditions whose first objective is the safety and health of the patient.

## Pathophysiology

It is the foundation of nursing practice as it helps build a solid foundation for the main responsibilities of a nurse such as ordering tests, diagnoses, treating acute and chronic illnesses, managing medications, and managing general healthcare.
